1 torque Module Index

1.1 torque Modules

Here is a list of all modules:

| | |
|--|----------|
| DRMAA interface. | 2 |
| Vector iteration functions. | 4 |
| Job template operations. | 2 |
| Session managing function. | 4 |
| Remembering submitted job in session. | 4 |

2 torque Data Structure Index

2.1 torque Data Structures

Here are the data structures with brief descriptions:

| | |
|--|----------|
| drmaa_job_iter_s (Iterates over submitted jobs set) | 5 |
| drmaa_job_s (Job data stored for each submitted job) | 6 |
| drmaa_job_template_s (Job template data) | 6 |
| drmaa_session_s (DRMAA session data) | 7 |

3 torque File Index

3.1 torque File List

Here is a list of all documented files with brief descriptions:

| | |
|--|----|
| <code>src/attrib.h</code> | ?? |
| <code>src/compat.h</code> (System compatibility functions) | 8 |
| <code>src/drmaa.h</code> (DRMAA library for Torque/PBS) | 8 |
| <code>src/drmaa_impl.h</code> | ?? |
| <code>src/error.h</code> (Rasing errors) | 14 |
| <code>src/jobs.h</code> (Remembering submitted job in session) | 14 |
| <code>src/lookup3.h</code> (32bit hash function implementation) | 15 |

4 torque Module Documentation

4.1 Job template operations.

This template is used to describe the job to be submitted. This description is accomplished by setting the desired scalar and vector attributes to their appropriate values. This template is then used in the job submission process.

4.2 DRMAA interface.

Modules

- group [Vector iteration functions.](#)
- group [Job template operations.](#)

The function `drmaa_allocate_job_template()` SHALL allocate a new job template, returned in jt.

Functions

- int [`drmaa_init`](#) (const char *contact, char *error_diagnosis, size_t error_diag_len)
The `drmaa_init()` function SHALL initialize DRMAA library and create a new DRMAA session, using the contact parameter, if provided, to determine to which DRMS to connect.
- int [`drmaa_exit`](#) (char *error_diagnosis, size_t error_diag_len)
The `drmaa_exit()` function SHALL disengage from DRMAA library and allow the DRMAA library to perform any necessary internal cleanup.
- int [`drmaa_get_attribute`](#) ([`drmaa_job_template_t`](#) *jt, const char *name, char *value, size_t value_len, char *error_diagnosis, size_t error_diag_len)
The function `drmaa_get_attribute()` SHALL fill the value buffer with up to value_len characters of the scalar attribute, name's, value in the given job template.

- int `drmaa_set_vector_attribute` (`drmaa_job_template_t` **jt*, const char **name*, const char **value*[], char **error_diagnosis*, size_t *error_diag_len*)

*The function `drmaa_set_vector_attribute()` SHALL set the vector attribute, *name*, in the job template, *jt*, to the value(s), *value*.*

- int `drmaa_get_vector_attribute` (`drmaa_job_template_t` **jt*, const char **name*, `drmaa_attr_values_t` ***values*, char **error_diagnosis*, size_t *error_diag_len*)

*The function `drmaa_get_vector_attribute()` SHALL store in *values* an opaque values string vector containing the values of the vector attribute, *name*'s, *value* in the given job template.*

- int `drmaa_get_attribute_names` (`drmaa_attr_names_t` ***values*, char **error_diagnosis*, size_t *error_diag_len*)

*The function `drmaa_get_attribute_names()` SHALL return the set of supported scalar attribute names in an opaque names string vector stored in *values*.*

- int `drmaa_get_vector_attribute_names` (`drmaa_attr_names_t` ***values*, char **error_diagnosis*, size_t *error_diag_len*)

*The function `drmaa_get_vector_attribute_names()` SHALL return the set of supported vector attribute names in an opaque names string vector stored in *values*.*

4.2.1 Function Documentation

4.2.1.1 int `drmaa_init` (const char **contact*, char **error_diagnosis*, size_t *error_diag_len*)

The `drmaa_init()` function SHALL initialize DRMAA library and create a new DRMAA session, using the *contact* parameter, if provided, to determine to which DRMS to connect.

This function MUST be called before any other DRMAA function, except for `drmaa_get_DRM_system()`, `drmaa_get_DRMAA_implementation()`, `drmaa_get_contact()`, and `drmaa_strerror()`. If *contact* is NULL, the default DRM system SHALL be used, provided there is only one DRMAA implementation in the provided binary module. When there is more than one DRMAA implementation in the binary module, `drmaa_init()` SHALL return the DRMAA_ERRNO_NO_DEFAULT_CONTACT_STRING_SELECTED error code. The `drmaa_init()` function SHOULD be called by only one of the threads. The main thread is RECOMMENDED. A call by another thread SHALL return the DRMAA_ERRNO_ALREADY_ACTIVE_SESSION error code.

4.2.1.2 int `drmaa_exit` (char **error_diagnosis*, size_t *error_diag_len*)

The `drmaa_exit()` function SHALL disengage from DRMAA library and allow the DRMAA library to perform any necessary internal cleanup.

This routine SHALL end the current DRMAA session but SHALL NOT affect any jobs (e.g, queued and running jobs SHALL remain queued and running). `drmaa_exit()` SHOULD be called by only one of the threads. The first call to call `drmaa_exit()` by a thread will operate normally. All other calls from the same and other threads SHALL fail, returning a DRMAA_ERRNO_NO_ACTIVE_SESSION error code.

4.2.1.3 int `drmaa_set_vector_attribute` (`drmaa_job_template_t` **jt*, const char **name*, const char **value*[], char **error_diagnosis*, size_t *error_diag_len*)

The function `drmaa_set_vector_attribute()` SHALL set the vector attribute, *name*, in the job template, *jt*, to the value(s), *value*.

The DRMAA implementation MUST accept value values that are arrays of one or more strings terminated by a NULL entry.

4.2.1.4 `int drmaa_get_attribute_names (drmaa_attr_names_t **values, char *error_diagnosis, size_t error_diag_len)`

The function `drmaa_get_attribute_names()` SHALL return the set of supported scalar attribute names in an opaque names string vector stored in *values*.

This vector SHALL include all required scalar attributes, all supported optional scalar attributes, all DRM-specific scalar attributes, and no unsupported optional attributes.

4.2.1.5 `int drmaa_get_vector_attribute_names (drmaa_attr_names_t **values, char *error_diagnosis, size_t error_diag_len)`

The function `drmaa_get_vector_attribute_names()` SHALL return the set of supported vector attribute names in an opaque names string vector stored in *values*.

This vector SHALL include all required vector attributes, all supported optional vector attributes, all DRM-specific vector attributes, and no unsupported optional attributes.

4.3 Vector iteration functions.

The `drmaa_get_next_X()` functions SHALL store up to *value_len* bytes of the next attribute name / attribute value / job identifier from the *values* opaque string vector in the *value* buffer. The opaque string vector's internal iterator SHALL then be moved forward to the next entry. If there are no more values those functions return DRMAA_ERRNO_INVALID_ARGUMENT (but this is outside DRMAA specification).

The `drmaa_get_num_X()` functions SHALL store the number of elements in the space provided by *size*.

The `drmaa_release_X()` functions free the memory used by the *values* opaque string vector. All memory used by strings contained therein is also freed.

4.4 Session managing function.

4.4.1 Detailed Description

Functions

- `int drmaa_create (drmaa_session_t **pc, const char *contact, char *errmsg, size_t errlen)`
Creates DRMAA session and opens connection with DRM.
- `int drmaa_destroy (drmaa_session_t *c, char *errmsg, size_t errlen)`
Closes connection with DRM (if any) and destroys DRMAA session data.

4.5 Remembering submitted job in session.

Data Structures

- `struct drmaa_job_s`
Job data stored for each submitted job.

- struct `drmaa_job_iter_s`
Iterates over submitted jobs set.

Functions

- void `drmaa_get_job_list_iter` (`drmaa_session_t` **session*, `drmaa_job_iter_t` **iter*)
Returns iterator to jobs held in DRMAA session.
- `drmaa_job_t` * `drmaa_get_next_job` (`drmaa_job_iter_t` **iter*)
Returns next job identifier from set or NULL if set finished.
- void `drmaa_add_job` (`drmaa_session_t` **c*, `drmaa_job_t` **job*)
Adds job identifier to session.
- bool `drmaa_find_job` (`drmaa_session_t` **c*, const char **jobid*, `drmaa_job_t` **found*, unsigned *flags*)
Checks if job with given identifier exist in hash table and optionally removes it.

4.5.1 Function Documentation

4.5.1.1 void `drmaa_get_job_list_iter` (`drmaa_session_t` * *session*, `drmaa_job_iter_t` * *iter*)

Returns iterator to jobs held in DRMAA session.

Caller thread should have `drmaa_session_s::jobs_mutex` acquired iterator remains valid until job list is modified (or lock is released).

4.5.1.2 void `drmaa_add_job` (`drmaa_session_t` * *c*, `drmaa_job_t` * *job*)

Adds job identifier to session.

Parameters:

- c* DRMAA session.
job Mallocoed drmaa_job_t structure with filled jobid field (also mallocoed).

4.5.1.3 bool `drmaa_find_job` (`drmaa_session_t` * *c*, const char * *jobid*, `drmaa_job_t` * *found*, unsigned *flags*)

Checks if job with given identifier exist in hash table and optionally removes it.

Parameters:

- c* Opened DRMAA session.
jobid Job identifier.
found If not NULL and job was found job session data will be stored here.
flags Information to store into session. If DRMAA_JOB_DISPOSE bit is set session data will be removed.

`job_flag_t`

5 torque Data Structure Documentation

5.1 drmaa_job_iter_s Struct Reference

```
#include <jobs.h>
```

5.1.1 Detailed Description

Iterates over submitted jobs set.

Data Fields

- unsigned [hash](#)

Hash value of job identifier.

The documentation for this struct was generated from the following file:

- [src/jobs.h](#)

5.2 drmaa_job_s Struct Reference

```
#include <jobs.h>
```

5.2.1 Detailed Description

Job data stored for each submitted job.

It is freed when job terminates and it's status is disposed by drmaa_wait() or drmaa_synchronize().

Data Fields

- [drmaa_job_t * next](#)

Next job in list or NULL.

- char * [jobid](#)

Job identifier from DRM.

- int [time_label](#)

Job submission timestamp increased in DRMAA session with each submitted job.

- bool [terminated](#)

Whether we know that job terminated and its status is waiting to rip.

- bool [suspended](#)

Whether job was suspended within session by drmaa_control().

5.2.2 Field Documentation

5.2.2.1 int drmaa_job_s::time_label

Job submission timestamp increased in DRMAA session with each submitted job.

5.2.2.2 bool drmaa_job_s::terminated

Whether we know that job terminated and its status is waiting to rip.

5.2.2.3 bool drmaa_job_s::suspended

Whether job was suspended within session by drmaa_control().

The documentation for this struct was generated from the following file:

- src/jobs.h

5.3 drmaa_job_template_s Struct Reference

```
#include <drmaa_impl.h>
```

5.3.1 Detailed Description

Job template data.

Data Fields

- drmaa_session_t * session
DRMAA session in which job template was created.
- drmaa_job_template_t * prev
Previous job template in list.
- drmaa_job_template_t * next
Next job template in list.
- void ** attrib
Table of DRMAA attributes.
- pthread_mutex_t mutex
Mutex for accessing job attributes.

5.3.2 Field Documentation

5.3.2.1 void** drmaa_job_template_s::attrib

Table of DRMAA attributes.

It is filled with N_DRMAA_ATTRIBS values which are either NULL (attribute not set) or string (scalar attribute) or NULL terminated array of strings (vector attribute).

The documentation for this struct was generated from the following file:

- src/drmaa_impl.h

5.4 drmaa_session_s Struct Reference

```
#include <drmaa_impl.h>
```

5.4.1 Detailed Description

DRMAA session data.

Data Fields

- int **pbs_conn**
PBS connection (or -1).
- char * **contact**
Contact to PBS server – ‘host[:port]’.
- drmaa_job_template_t * **jt_list**
Cyclic list (with sentinel) of job templates created in this DRMAA session.
- drmaa_job_t ** **job_hashtab**
Hash table of jobs which have to be remembered in DRMAA session (was submitted in this session and its status was not removed).
- int **next_time_label**
Will be assigned to next submitted job.
- pthread_mutex_t **conn_mutex**
Mutex for PBS connection.
- pthread_mutex_t **jobs_mutex**
*Mutex for **jt_list**, #job_list and **next_time_label**.*

The documentation for this struct was generated from the following file:

- src/drmaa_impl.h

6 torque File Documentation

6.1 src/compat.h File Reference

6.1.1 Detailed Description

System compatibility functions.

```
#include <stddef.h>
#include <stdarg.h>
```

6.2 src/drmaa.h File Reference

6.2.1 Detailed Description

DRMAA library for Torque/PBS.

Functions

- int **drmaa_init** (const char *contact, char *error_diagnosis, size_t error_diag_len)

The **drmaa_init()** function SHALL initialize DRMAA library and create a new DRMAA session, using the contact parameter, if provided, to determine to which DRMS to connect.

- int **drmaa_exit** (char *error_diagnosis, size_t error_diag_len)

The drmaa_exit() function SHALL disengage from DRMAA library and allow the DRMAA library to perform any necessary internal cleanup.
- int **drmaa_get_attribute** (drmaa_job_template_t *jt, const char *name, char *value, size_t value_len, char *error_diagnosis, size_t error_diag_len)

The function drmaa_get_attribute() SHALL fill the value buffer with up to value_len characters of the scalar attribute, name's, value in the given job template.
- int **drmaa_set_vector_attribute** (drmaa_job_template_t *jt, const char *name, const char *value[], char *error_diagnosis, size_t error_diag_len)

The function drmaa_set_vector_attribute() SHALL set the vector attribute, name, in the job template, jt, to the value(s), value.
- int **drmaa_get_vector_attribute** (drmaa_job_template_t *jt, const char *name, drmaa_attr_values_t **values, char *error_diagnosis, size_t error_diag_len)

The function drmaa_get_vector_attribute() SHALL store in values an opaque values string vector containing the values of the vector attribute, name's, value in the given job template.
- int **drmaa_get_attribute_names** (drmaa_attr_names_t **values, char *error_diagnosis, size_t error_diag_len)

The function drmaa_get_attribute_names() SHALL return the set of supported scalar attribute names in an opaque names string vector stored in values.
- int **drmaa_get_vector_attribute_names** (drmaa_attr_names_t **values, char *error_diagnosis, size_t error_diag_len)

The function drmaa_get_vector_attribute_names() SHALL return the set of supported vector attribute names in an opaque names string vector stored in values.
- int **drmaa_run_job** (char *job_id, size_t job_id_len, const drmaa_job_template_t *jt, char *error_diagnosis, size_t error_diag_len)

The drmaa_run_job() function submits a single job with the attributes defined in the job template, jt.
- int **drmaa_run_bulk_jobs** (drmaa_job_ids_t **jobids, const drmaa_job_template_t *jt, int start, int end, int incr, char *error_diagnosis, size_t error_diag_len)

The drmaa_run_bulk_jobs() function submits a set of parametric jobs which can be run concurrently.
- int **drmaa_control** (const char *job_id, int action, char *error_diagnosis, size_t error_diag_len)

The drmaa_control() function SHALL enact the action indicated by action on the job specified by the job identifier, jobid.
- int **drmaa_job_ps** (const char *job_id, int *remote_ps, char *error_diagnosis, size_t error_diag_len)

The drmaa_job_ps() function SHALL store in remote_ps the program status of the job identified by job_id.
- int **drmaa_synchronize** (const char *job_ids[], signed long timeout, int dispose, char *error_diagnosis, size_t error_diag_len)

The drmaa_synchronize() function SHALL cause the calling thread to block until all jobs specified by job_ids have finished execution.

- int `drmaa_wait` (const char **job_id*, char **job_id_out*, size_t *job_id_out_len*, int **stat*, signed long *timeout*, drmaa_attr_values_t ***rusage*, char **error_diagnosis*, size_t *error_diag_len*)
*The drmaa_wait() function SHALL wait for a job identified by *job_id* to finish execution or fail.*
- const char * `drmaa_strerror` (int *drmaa_errno*)
The drmaa_strerror() function SHALL return the error string describing the DRMAA error number drmaa_errno.
- int `drmaa_get_contact` (char **contact*, size_t *contact_len*, char **error_diagnosis*, size_t *error_diag_len*)
The drmaa_get_contact() function, if called before `drmaa_init()`, SHALL return a string containing a comma-delimited list of default DRMAA implementation contacts strings, one per DRM implementation provided.
- int `drmaa_version` (unsigned int **major*, unsigned int **minor*, char **error_diagnosis*, size_t *error_diag_len*)
The drmaa_version() function SHALL set major and minor to the major and minor versions of the DRMAA C binding specification implemented by the DRMAA implementation.
- int `drmaa_get_DRM_system` (char **drm_system*, size_t *drm_system_len*, char **error_diagnosis*, size_t *error_diag_len*)
The drmaa_get_DRM_system() function, if called before `drmaa_init()`, SHALL return a string containing a comma-delimited list of DRM system identifiers, one per DRM system implementation provided.
- int `drmaa_get_DRMAA_implementation` (char **drmaa_impl*, size_t *drmaa_impl_len*, char **error_diagnosis*, size_t *error_diag_len*)
The drmaa_get_DRMAA_implementation() function, if called before `drmaa_init()`, SHALL return a string containing a comma-delimited list of DRMAA implementations, one per DRMAA implementation provided.
- void `drmaa_set_logging_output` (FILE **file*)
Specify place where goes log messages from library when they were enabled at configure time.

6.2.2 Function Documentation

6.2.2.1 int `drmaa_run_job` (char **job_id*, size_t *job_id_len*, const `drmaa_job_template_t` **jt*, char **error_diagnosis*, size_t *error_diag_len*)

The `drmaa_run_job()` function submits a single job with the attributes defined in the job template, *jt*.

Upon success, up to *job_id_len* characters of the submitted job's job identifier are stored in the buffer, *job_id*.

6.2.2.2 int `drmaa_run_bulk_jobs` (`drmaa_job_ids_t` ***jobids*, const `drmaa_job_template_t` **jt*, int *start*, int *end*, int *incr*, char **error_diagnosis*, size_t *error_diag_len*)

The `drmaa_run_bulk_jobs()` function submits a set of parametric jobs which can be run concurrently.

The attributes defined in the job template, *jt* are used for every parametric job in the set. Each job in the set is identical except for its index. The first parametric job has an index equal to *start*. The next job has an index equal to *start* + *incr*, and so on. The last job has an index equal to *start* + n * *incr*, where n is equal to (*end* - *start*) / *incr*. Note that the value of the last job's index may not be equal to *end* if the difference between *start* and *end* is not evenly divisible by *incr*. The smallest valid value for

start is 1. The largest valid value for *end* is 2147483647 ($2^{31} - 1$). The *start* value must be less than or equal to the *end* value, and only positive index numbers are allowed. The index number can be determined by the job in an implementation specific fashion. On success, an opaque job id string vector containing job identifiers for all submitted jobs SHALL be returned into *job_ids*. The job identifiers in the opaque job id string vector can be extracted using the drmaa_get_next_job_id() function. The caller is responsible for releasing the opaque job id string vector returned into *job_ids* using the drmaa_release_job_ids() function.

6.2.2.3 int drmaa_control (const char **job_id*, int *action*, char **error_diagnosis*, size_t *error_diag_len*)

The drmaa_control() function SHALL enact the action indicated by *action* on the job specified by the job identifier, *jobid*.

The action parameter's value may be one of the following:

- DRMAA_CONTROL_SUSPEND
- DRMAA_CONTROL_RESUME
- DRMAA_CONTROL_HOLD
- DRMAA_CONTROL_RELEASE
- DRMAA_CONTROL_TERMINATE The drmaa_control() function SHALL return after the DRM system has acknowledged the command, not necessarily after the desired action has been performed. If *jobid* is DRMAA_JOB_IDS_SESSION_ALL, this function SHALL perform the specified action on all jobs submitted during this session as of this function is called.

6.2.2.4 int drmaa_job_ps (const char **job_id*, int **remote_ps*, char **error_diagnosis*, size_t *error_diag_len*)

The drmaa_job_ps() function SHALL store in *remote_ps* the program status of the job identified by *job_id*.

The possible values of a program's staus are:

- DRMAA_PS_UNDETERMINED
- DRMAA_PS_QUEUED_ACTIVE
- DRMAA_PS_SYSTEM_ON_HOLD
- DRMAA_PS_USER_ON_HOLD
- DRMAA_PS_USER_SYSTEM_ON_HOLD
- DRMAA_PS_RUNNING
- DRMAA_PS_SYSTEM_SUSPENDED
- DRMAA_PS_USER_SUSPENDED
- DRMAA_PS_DONE
- DRMAA_PS_FAILED

Terminated jobs have a status of DRMAA_PS_FAILED.

6.2.2.5 int drmaa_synchronize (const char * job_ids[], signed long timeout, int dispose, char * error_diagnosis, size_t error_diag_len)

The drmaa_synchronize() function SHALL cause the calling thread to block until all jobs specified by *job_ids* have finished execution.

If *job_ids* contains DRMAA_JOB_IDS_SESSION_ALL, then this function SHALL wait for all jobs submitted during this DRMAA session as of the point in time when drmaa_synchronize() is called. To avoid thread race conditions in multithreaded applications, the DRMAA implementation user should explicitly synchronize this call with any other job submission calls or control calls that may change the number of remote jobs.

The *timeout* parameter value indicates how many seconds to remain blocked in this call waiting for results to become available, before returning with a DRMAA_ERRNO_EXIT_TIMEOUT error code. The value, DRMAA_TIMEOUT_WAIT_FOREVER, MAY be specified to wait indefinitely for a result. The value, DRMAA_TIMEOUT_NO_WAIT, MAY be specified to return immediately with a DRMAA_ERRNO_EXIT_TIMEOUT error code if no result is available. If the call exits before the timeout has elapsed, all the jobs have been waited on or there was an interrupt. The caller should check system time before and after this call in order to be sure of how much time has passed. The *dispose* parameter specifies how to treat the reaping of the remote job's internal data record, which includes a record of the job's consumption of system resources during its execution and other statistical information. If the *dispose* parameter's value is 1, the DRMAA implementation SHALL dispose of the job's data record at the end of the drmaa_synchronize() call. If the *dispose* parameter's value is 0, the data record SHALL be left for future access via the drmaa_wait() method.

6.2.2.6 int drmaa_wait (const char * job_id, char * job_id_out, size_t job_id_out_len, int * stat, signed long timeout, drmaa_attr_values_t ** rusage, char * error_diagnosis, size_t error_diag_len)

The drmaa_wait() function SHALL wait for a job identified by *job_id* to finish execution or fail.

If the special string, JOB_IDS_SESSION_ANY, is provided as the *job_id*, this function will wait for any job from the session to finish execution or fail. In this case, any job for which exit status information is available will satisfy the requirement, including jobs which previously finished but have never been the subject of a drmaa_wait() call. This routine is modeled on the wait3 POSIX routine.

The *timeout* parameter value indicates how many seconds to remain blocked in this call waiting for a result, before returning with a DRMAA_ERRNO_EXIT_TIMEOUT error code. The value, DRMAA_TIMEOUT_WAIT_FOREVER, MAY be specified to wait indefinitely for a result. The value, DRMAA_TIMEOUT_NO_WAIT, MAY be specified to return immediately with a DRMAA_ERRNO_EXIT_TIMEOUT error code if no result is available. If the call exits before the timeout has elapsed, the job has been successfully waited on or there was an interrupt. The caller should check system time before and after this call in order to be sure of how much time has passed.

Upon success, drmaa_wait() fills *job_id_out* with up to *job_id_out_len* characters of the waited job's id, *stat* with the a code that includes information about the conditions under which the job terminated, and *rusage* with an array of <name>=<value> strings that describe the amount of resources consumed by the job and are implementation defined. The *stat* parameter is further described below. The *rusage* parameter's values may be accessed via drmaa_get_next_attr_value().

The drmaa_wait() function reaps job data records on a successful call, so any subsequent calls to drmaa_wait() will fail, returning a DRMAA_ERRNO_INVALID_JOB error code, meaning that the job's data record has already been reaped. This error code is the same as if the job were unknown. If drmaa_wait() exists due to a timeout, DRMAA_ERRNO_EXIT_TIMEOUT is returned and no rusage information is reaped. (The only case where drmaa_wait() can be successfully called on a single job more than once is when the previous call(s) to drmaa_wait() returned DRMAA_ERRNO_EXIT_TIMEOUT.)

The *stat* parameter, set by a successful call to drmaa_wait(), is used to retrieve further input about

the exit condition of the waited job, identified by job_id_out, through the following functions: drmaa_wifexited(), drmaa_wexitstatus(), drmaa_wifsignaled(), drmaa_wtermsig(), drmaa_wcoredump() and drmaa_wifaborted().

6.2.2.7 int drmaa_get_contact (char * contact, size_t contact_len, char * error_diagnosis, size_t error_diag_len)

The drmaa_get_contact() function, if called before [drmaa_init\(\)](#), SHALL return a string containing a comma-delimited list of default DRMAA implementation contacts strings, one per DRM implementation provided.

If called after [drmaa_init\(\)](#), drmaa_get_contacts() SHALL return the contact string for the DRM system for which the library has been initialized.

6.2.2.8 int drmaa_get_DRM_system (char * drm_system, size_t drm_system_len, char * error_diagnosis, size_t error_diag_len)

The drmaa_get_DRM_system() function, if called before [drmaa_init\(\)](#), SHALL return a string containing a comma-delimited list of DRM system identifiers, one per DRM system implementation provided.

If called after [drmaa_init\(\)](#), drmaa_get_DRM_system() SHALL return the selected DRM system.

6.2.2.9 int drmaa_get_DRMAA_implementation (char * drmaa_impl, size_t drmaa_impl_len, char * error_diagnosis, size_t error_diag_len)

The drmaa_get_DRMAA_implementation() function, if called before [drmaa_init\(\)](#), SHALL return a string containing a comma-delimited list of DRMAA implementations, one per DRMAA implementation provided.

If called after [drmaa_init\(\)](#), drmaa_get_DRMAA_implementation() SHALL return the selected DRMAA implementation.

6.2.2.10 void drmaa_set_logging_output (FILE *file)

Specify place where goes log messages from library when they were enabled at configure time.

By default they are written to standard error stream.

Parameters:

file File to write to.

6.3 src/error.h File Reference

6.3.1 Detailed Description

Rasing errors.

```
#include <stddef.h>
```

Functions

- int [drmaa_get_errno_error](#) (char *error_diagnosis, size_t error_diag_len)

Gets last system error message and returns its code.

- int `drmaa_get_pbs_error` (char *error_diagnosis, size_t error_diag_len)
Retrieves last PBS error message.
- int `drmaa_map_pbs_error` (int pbs_errcode)
Maps PBS error code into DMRAA code.

6.4 src/jobs.h File Reference

6.4.1 Detailed Description

Remembering submitted job in session.

```
#include <drmaa_impl.h>
```

Data Structures

- struct `drmaa_job_s`
Job data stored for each submitted job.
- struct `drmaa_job_iter_s`
Iterates over submitted jobs set.

Functions

- void `drmaa_get_job_list_iter` (drmaa_session_t *session, drmaa_job_iter_t *iter)
Returns iterator to jobs held in DRMAA session.
- drmaa_job_t * `drmaa_get_next_job` (drmaa_job_iter_t *iter)
Returns next job identifier from set or NULL if set finished.
- void `drmaa_add_job` (drmaa_session_t *c, drmaa_job_t *job)
Adds job identifier to session.
- bool `drmaa_find_job` (drmaa_session_t *c, const char *jobid, drmaa_job_t *found, unsigned flags)
Checks if job with given identifier exist in hash table and optionally removes it.

6.5 src/lookup3.h File Reference

6.5.1 Detailed Description

32bit hash function implementation.

Taken from: <http://burtleburtle.net/bob/hash/>

```
#include <pbs_config.h>
```
